Safer Surfacing

Where play equipment requires safety surfacing or safety surfacing is preferred Playscheme currently offer three types of safety surfacing.

Woodchip Loose-fill - Ideal for rural surroundings and promoting a natural aesthetic, woodchip is installed to a depth of 300mm to act as safety surface. Under laid with a selectively permeable membrane our woodchip areas remain free from plant growth.

Honeycomb Rubber Matting - Similarly effective in maintaining a natural look, our Honeycomb Rubber Matting provides a safety surface with minimal visual impact. Ideally laid over existing turf, the grass grows up through the matting and can be maintained as normal. The matting is anchored with pegs and ties and ultimately knits to the grass itself.

Wet Pour Rubber - A continuous impact absorption surface made from rubber granules and a binding solution. Wet Pour is laid over base work or existing hard surfaces in two layers. A sub-layer of rubber shred is over laid with a fine granule topping to a smooth finish. Wet Pour can also be laid in various colours or graphics can be incorporated through the use of different colours.
